

Molluscum Contagiosum

Protocol for Extracting Warts

- Clean areas with **SilverBarSOAP™** or **SilverBODYWASH™**
- For maturing warts: The waxy core is highly contagious. The best way to prevent severe spreading is to extract the core using gloves, sterile tweezers, or squeezing with protected fingers, and using the **The Molluscum Electronic Accelerator™** with **SilverCURE™ Ointment**
- The warts will bleed profusely at first. Compress with a clean tissue or gauze until bleeding stops. Then apply **SILVER SKIN™ Sealant**.
- Apply **SILVERSpray™** or **SILVERLotion™** over the whole body as a preventative measure to affected child 3 times daily and to the non-affected family members 2 times daily.
- Change clothes and pajamas daily. Wash bath, hand towels, and washcloths after single use. Silver, or therapeutic grade oils such as tea tree, lavender or clove may be added to sterilize wash.
- For children with eczema or other skin conditions, it is imperative to keep their outbreaks to a minimum. Avoid high allergy situations, sugary & fried foods. Choose foods high in zinc (zinc is essential for healthy skin)
- Add other health promoting supplements such as Cod Liver Oil, Probiotics, Whole food based Vitamins and Minerals and Enzymes

SILVER CURE™

What products are available?

- SilverCURE™ Ointment
- SilverSKIN™ Sealant
- SilverBODYWASH™
- SilverSPRAY™
- SilverLOTION™
- SilverBarSOAP™
- Molluscum Electronic Accelerator™

**DON'T LET THIS BE
YOUR CHILD!**

Molluscum Contagiosum

“This was my child after 1 1/2 years. Her body was covered with lesions like these... and with no signs of improvement. This condition is insidious left unchecked, especially for children with unique conditions (eczema, auto immune disorders)

The team at **SILVER CURE™** helped by listening to our specific situation, educating us about the nature of this condition, and discerning the best course of action for my daughter

After using the **SILVER CURE™** System and being completely diligent in the process, my daughter started kindergarten with crystal clear **HEALTHY** skin”

- Tara Rayburn, mother of 2 children diagnosed with Molluscum Contagiosum

Molluscum Contagiosum

What is Molluscum Contagiosum?

Becoming more prevalent in both children and adults today is a contagious skin condition known as Molluscum Contagiosum. One Pediatrician in New York claims 80% of his patients have already had or will have Molluscum.

ReBuilder Medical Technologies, Inc. has developed a family of products to stop the reproduction, and then resolve the remaining lesions. Left untreated Molluscum Contagiosum can spread all over the body, is contagious to others, and can last for years.

We invent, develop, and produce all our products on site in our lab, here in the USA, so that we know and control first hand the quality of the ingredients that are used, the cleanliness of the manufacturing process, and test each batch ourselves. Knowing children's skin is very sensitive and that a lot of our patients also have eczema, everything we make is hypo-allergenic.

Current treatments in a Physician's office include freezing, burning, cutting, and acid treatments which only destroy the individual lesion and can damage the surrounding skin, making it more susceptible to spreading from the drainage and trauma. Those treatments offer no protection against stopping the reproduction or spreading to other family members.

Only SilverCure™ both stops and helps prevent the lesions from spreading. Silver is approved by the FDA and has a long and successful medical history of safety and effectiveness, as has tea tree oil and petroleum jelly.

Molluscum DO's

- Take this diagnosis very seriously, especially if there are any unique considerations such as eczema, auto immune issues, or any case of lowered immunity.
- Treat it like a contagious virus...because it IS. Wash hands often, get rest, eat a nutritional, easy to digest diet so the body can focus on healing. Avoid sugar as it lowers immune response.
- Take Showers instead of baths.
- Use the Silver products topically and on moist areas such as around sinks and showers to avoid spreading the virus.
- Change pillowcases daily, sheets often. If any warts open at night, change all bedding.
- Wear long sleeves and long pants for sleeping in case warts burst during the night. Wash pajamas daily or wear a different pair each night. The white waxy core in the wart is what spreads the virus. If that comes in contact with other open areas, the warts will spread.
- Keep open lesions covered with clothing, **SILVER SKIN™ Sealant** or gauze wraps.
- Wipe down chairs and furniture or use **SILVER Spray™**. Cover cloth furniture with a sheet to keep core's from infecting others.
- Educate yourself and others about habits to keep this virus from spreading further.
- Understand that even though your child might not develop a serious case, there are many immune compromised children and adults who could contract Molluscum from one careless action and battle with it for years to come.
- Know that with extreme diligence in these areas your family can move past this condition without having years of frustration and the potential infection of others.

Molluscum DO NOT's

- Do not take baths. It draws the warts out and they look for new entry points on the body. A child with eczema often has open places on the skin, and although oatmeal baths are comforting, they can cause the molluscum to spread rapidly
- Do not allow affected family members to shower or bathe with other children. Disinfect bathrooms with **SILVER Spray™** or white vinegar.
- Avoid water activities such swimming pools, waterparks, slip and slides, and beaches. The perimeter water is like a petri dish for viruses and bacteria. This is where most children contract the Molluscum virus.
- Do not allow child to spend extended time in sweaty or damp clothing. The hot, wet environment is ripe for spreading the contagion.
- Do NOT let affected children sleep in bed with anyone including parents. Again, due to warmth and skin to skin contact, the possibility for infection is great.
- For small children, avoid hosting playdates as with any virus or bacterial issue it is possible to infect others.
- Avoid contact sports or keep long sleeves, pants or bandages on during them since the moisture, exertion and skin to skin contact may infect others.
- For those with sensitive skin, avoid adhesive bandages. They tend to irritate the surrounding skin and create new openings for the virus to spread.

MOLLUSCUM CONTAGIOSUM
Catch it early, stay diligent, and prevent this from happening to your child.
