

Website Development Resources

Joomla! – an open source content management system with a sophisticated web application framework.

You can download the platform, install it and build your own websites.

<http://www.joomla.org>

Network Solutions – provides a template-driven website development platform (one example among many).

With a hosting account, you can build your own website using one of their online templates. You have access to an administrative backend and can add or modify content whenever you like.

J Grant Design – an excellent web developer (based in FL) who specializes in clean ajax-driven sites with a Web 2.0 feel.

I've used Jon for two of my websites. He's fast, resourceful and reasonably priced. You'll be amazed how quickly he can pump stuff out!

<http://www.jgrantdesign.com>

Aplus.net – this is where I register all my domains.

This company has a great control panel where you can manage your various domains. They're reasonably priced and I've only ever had one problem.

<http://www.aplus.net>

1websitesolution – this is where I host my various websites.

I pay \$10.99 per month and have 100 gigs of memory. I can store as many websites on their server as I can fit into 100 gigs – 9 websites so far!
